Review: You Can See Everything blurs the view of Elizabeth Holmes' deceit

Ars Technica · 2026-10-30

In 2015, biomedical entrepreneur Elizabeth Holmes was Silicon Valley’s golden girl, lauded as the youngest and richest self-made female billionaire thanks to the company she founded, Theranos, which was valued at $9 billion at the height of its success. Then it all came crashing down when accusations of fraud surfaced about the company’s signature blood-testing device, culminating in a sensational trial. Holmes was convicted on four counts and sentenced to 11 years in prison.

Holmes is back in the headlines thanks to a new film, You Can See Everything , which depicts the final days before Holmes, having exhausted her appeals , went to prison. Co-directed by Nathan Fielder and Lance Oppenheim , it’s a surreal, absurdist piece that has largely been received with gushing enthusiasm and no small amount of hype, with some declaring it the best film of the year.

A few contrarian voices have emerged over the past week with much-needed reality checks, but there’s no denying the film is destined to be an awards-season darling.

Pardon me for joining the buzzkills, but I cannot in good conscience jump on the You Can See Everything bandwagon. Sure, it has its moments, and the second half is highly entertaining, but there’s nothing here to warrant all the breathless hyperbole.

Silicon Valley wants you to invest in miracles

The Verge · 2026-10-30

Investing in any stock is kind of like gambling in the sense that you're betting your money on a company's future performance. But how do you bet on a technology that could, in the worst-case scenario, "pose catastrophic or existential risks to humanity," or best case, "bring forth an age of miracles"?

To some extent, Anthropic suggests in a letter at the top of its S-1 filing, you have to just believe.

Anthropic's 335-page S-1 prospectus, filed Monday, is part of a steady hype escalation in Silicon Valley's interactions with Wall Street. In some ways, it's not even that bizarre; SpaceX IPO'd in June after filing an S-1 that referenced dinosaurs and "colonizing Mars." But its sweeping language and sheer volume — including 94 pages of risk factors — is a sometimes overwhelming collision of AI industry rhetoric and a hard financial pitch.

Out-of-this-world promises are integral to Anthropic's survival as a company . That doesn't make reading the S-1 any less surreal.

In the letter, Anthropic's founders urge prospective stock owners "not to think of your purchase in purely transactional terms. We hope you will see it instead as an opportunity to be part of something greater." The march toward advanced AI "is one of the seminal moments in human history," the letter says.

Anthropic spent $2.75m guarding Dario Amodei, four times his salary

The Next Web · 2026-10-30

Dario Amodei, chief executive of Anthropic, at Fortune Brainstorm Tech in Park City, Utah, in July 2023.

Anthropic spent $2,745,874 on personal security for chief executive Dario Amodei in 2025, more than four times his $654,167 salary. The figure is in the company's IPO filing . The filing also says its co-founders' pledge to give away 80% of their stakes is not legally binding.

Bilin Lin first highlighted the security costs for Fortune , and Robert Frank reported on the giving pledge for CNBC . TNW checked both against the filing, which Anthropic made public on 26 October.

The security spending makes up most of the $4,010,641 listed as Amodei's "other compensation". His total pay for 2025 was $17,958,298, mostly stock and option awards.

Anthropic also paid $97,055 for his personal travel by private jet, which his security programme requires. It spent $1,293,629 on protection, home security and transport for his sister Daniela Amodei, the company's president.

A security firm studied the risks to both siblings in 2025, according to the filing. Based on that study and rising media attention, the board found "bona fide business-related, heightened security concerns" linked to their roles.

Can AI data centers be mass-produced like cars? This startup aims to find out

TechCrunch · 2026-10-30

AI infrastructure company Runware is making news again, just months after unveiling the Sonic Inference Pod, a modular data center built in a factory and shipped to customers ready to install. Now the company has bigger plans. It told TechCrunch it wants to build a factory that assembles these pods on a production line, as if they were cars.

The idea isn’t entirely new. Companies like Crusoe and Schneider Electric also sell prefabricated pods, but Runware says it can ship its pods faster.

Flaviu Radulescu, co-founder and CEO of Runware, told TechCrunch that the company plans to scale production at its Romania-based factory to 30 megawatts of data center capacity per day by 2028, or nearly 1 gigawatt per month. That’s a whole lot of capacity: At that pace, Runware would produce roughly as much in a year as the entire U.S. was expected to add in data center power this year, about 10 gigawatts .

But it also reflects an industrywide push to deploy data centers faster and more efficiently.

Nvidia announced, for example, the Vera Rubin AI factories and the DSX POD earlier this year. Both are also meant to make it faster and easier for companies to build their own AI data centers. The difference with Runware, though, is that it says it has actually built a factory rather than just designed the infrastructure that would let others build one.
