Could United Launch Alliance's money problems finally force its owners to sell?

Ars Technica · 2026-09-11

ULA is preparing to resume launching the Vulcan rocket in the coming weeks.

Pretty much every rocket company in the United States, save one, has embraced two fundamental tenets: reusability and diversification.

Most famously, SpaceX branched out from reusable rockets to pursue and dominate a growing spectrum of space services: cargo delivery, human spaceflight, satellite production, broadband, and, perhaps soon, orbital data centers and in-space manufacturing.

Blue Origin is evolving from a pure rocket company into a satellite manufacturer, robotics developer, and, most recently, a potential competitor for SpaceX's Starlink network.

Rocket Lab used a different approach to diversify after achieving success with its small Electron launch vehicle.

The company relocated its headquarters from New Zealand to Southern California, started building spacecraft and payloads, and then went on a spree of corporate acquisitions to expand into satellite communications and take on a new role as a merchant supplier of satellite components and sensors. It's now in a stage of advanced development of its partially reusable next-generation Neutron launch vehicle.

Trump dismisses AI extinction fears as lab staff urge a slowdown

The Next Web · 2026-09-11

Donald Trump says he has no concerns about AI causing human extinction and wants to stay ahead of China. His answer came as Anthropic and OpenAI employees urged a slowdown and lawmakers proposed new rules. The EU called for global ones before Trump meets Xi Jinping this month.

President Donald J. Trump oversees Operation Epic Fury at Mar-a-Lago, Palm Beach, FL, March 1, 2026.

US President Donald Trump has no concerns about AI leading to human extinction. “No, I don’t have any,” he told reporters on Thursday, as he left Dallas. Jeff Mason reported the exchange for Bloomberg .

Trump said his worry was losing the race. “I have concerns that if we don’t win AI, we’re going to be put in a very bad position,” he said. He put the US lead over China at about a year, “which is, you know, considered a lot”, CNBC ’s Kai Nicol-Schwarz reported.

His answer came in a week of warnings. Employees at Anthropic and OpenAI spoke out. So did members of Congress and the European Commission. Washington and Beijing, meanwhile, prepared for a summit.

It started with Jacob Coxon. The pretraining researcher resigned from Anthropic this week. On X, he said Anthropic and OpenAI were “racing straight to self-improving superintelligence and gambling with our lives”.

How This Doctor-Turned-Startup-Founder Decided To Fix The Healthcare Staffing Crunch: Make Employers Apply

Crunchbase News · 2026-09-11

Editor's note: The following is the sixth profile in a series of articles about startup founders from non-technical backgrounds who have launched successful venture-backed companies. Read the previous interviews with MagicSchool AI founder Adeel Khan [here](#) , Trunk Tools founder Sarah Buchner [here](#) , Tabs founder Ali Hussain [here](#) , Craft founder Ilya Levtoy [here](#) , and GC AI founder Cecilia Ziniti [here](#) .

After completing medical school in London, Iman Abuzeid decided not to pursue a residency. Her father was disappointed.

But she didn't change her mind because she lost interest in healthcare. Instead, Abuzeid realized she wanted to work on problems affecting more people than she could treat individually.

"Working as a doctor is great, but you're only working with one patient at a time," she said in an interview with Crunchbase News. With software, "you have millions of users using your products."

Abuzeid went on to co-found Incredible Health , a San Francisco-based healthcare hiring platform that has raised about \$97.5 million from investors such as Andreessen Horowitz , Base10 Partners , Obvious Ventures , Precursor Ventures and NFX .

When machines attack: frontier AI cyber threats and policy responses in the financial sector

Bank for International Settlements · 2026-09-09

When machines attack: frontier AI cyber threats and policy responses in the financial sector iii

Abstract

Frontier artificial intelligence (AI) models are a game changer in the cyber threat landscape. Unlike earlier generations of AI models, they can autonomously identify critical vulnerabilities, develop effective exploits and conduct increasingly complex multi-step cyber operations, thus reducing the expertise, time and resources needed to carry out sophisticated attacks.

At the same time, these capabilities offer significant defensive opportunities, including faster vulnerability discovery, threat detection and incident response.

The risks for financial institutions arise from compressed cyber remediation windows, higher likelihood of breach and amplified third-party dependencies.

By collapsing the window from discovery to exploitation and automating exploit chaining, frontier models materially increase the likelihood of breach, with unpatched software becoming the leading initial access vector in many incidents. Reliance on common cloud, software and frontier AI providers introduces concentration and sovereign access risks, whereby a single provider's disruption or policy decision can cascade across firms and jurisdictions.
